

## Environmental policy

As a global company, we do everything we can to mitigate any negative effects that producing our products could have on the earth. We introduce more environmentally friendly processes, offer a carbon recycling service to our customers and use renewable raw materials for our products where possible, mainly coconut shell. Coconuts are a major agricultural product in South and Southeast Asia. Coconut shell is a byproduct from the food processing industry and is a renewable resource to Jacobi. The shell is commonly burned as fuel but the conversion of the shell to activated carbon fixes the carbon into a solid form. This means our CO<sub>2</sub> footprint is then favorable due to the continuous CO<sub>2</sub>-capture of the shell.

We are committed to continuously develop and improve our environmental impact, based on the idea of cycles to sustainable development.

### In this policy statement we commit our company to:

- Complying with all relevant environmental legislation, regulations and approved codes of practice.
- Seeking to keep wastage to a minimum and maximise the efficient use of materials and resources.
- Regularly training for our staff so that we all work in accordance with this policy and within an environmentally aware culture.
- Monitoring and continuously improving our environmental performance.

The policy statement will be regularly reviewed and update as necessary. The management team endorses these policy statements and is fully committed to their implantation.
